There are several basic concepts that Photoshop users should know if they want to master Photoshop.

These are the building blocks of Photoshop. Let's take a look at what these are. Understanding an RGB

---

# Color Space Adobe

Photoshop uses a format called a color space, which is the base of how an image's color is represented in the file and throughout its life cycle. In digital image files, a color is made up of small dots of light called pixels. These pixels are represented in computer memory as small numbers that indicate the size of the color. If you want to work

---

with a red image, you must understand the color space that represents red. The different color spaces are:

CMYK - Also known as color, this is the color space most commonly associated with offset printing CMY -

This color space contains the three primary color (CMY) and is the basis for today's computer screen

color RGB - This is the most commonly used color space

---

for computers and is the color space you're likely to see when you open a document in Photoshop

Examples of color spaces can be seen below (the following color images are resized to 400 pixels wide for ease of viewing): If you have a reference photo of a red car, you can understand how red can be represented. The dark dots on the car are the pixels in the image that

---

make up the color red.

CMYK vs. RGB Adobe initially used what is known as the RGB color space (named for red, green, and blue), which is commonly known as the system-wide color space. This is how most of the world works today. RGB was an intentional choice made by Adobe to increase the speed of the computer processing.

The RGB color space

---

includes three colors. To display the pixels of a color, the RGB color space sends the three numbers (red, green, and blue) across the wire to your screen.

However, for printing, CMYK color spaces are more useful because CMYK represents four colors. Your printer can represent one CMYK color with four RGB colors. So, if you want to print a red car, your

---

printer would print three cyan, magenta, and yellow.

## Changing Color Spaces

Another aspect of the color space you need to understand is how to change the color space of a document. You can do this by changing the color space in the Color Settings menu in Photoshop. P

you step by step how to create a tree icon in Photoshop. What you will need This icon was created in Photoshop 2020. We also created this tutorial for free in the same version. You should download this tutorial if you want to know how to create a tree icon in Photoshop. 1. Create a new document I started with a new document and chose square canvas. 2. Add a

---

layer Add a new layer above the Canvas. 3. Create a new layer and the group it into the new layer Drag the Image Tool (or Image > Image Size) on the new layer and press D to create a new layer. 4. You can change this layer to the Multiply or Color Burn effect We'll use the Color Burn effect on this layer. 5. Fill the selection with black Use the color picker to fill it

---

with black. 6. Zoom in  
Zoom in to see all the details  
that you can add to this  
layer. 7. Make changes to  
this layer We'll move the  
image to the left and make  
the tree rounder to create a  
shape. You can use the  
Move Tool (M) or move this  
layer with the arrows. Select  
the Ellipse Tool (L). Scroll  
down the tool bar until you  
see the Polygonal tool (U).  
Then with the Ellipse Tool

---

(L), draw a polygonal shape. You can also move it using the arrows. Move the layer to the left using the arrow buttons on the top. You can also use the move option in the layers panel. There are many more options in the Layers Panel. You can use the Eraser Tool (E) to erase the two red areas to create the shape. You can also use the black arrows on the top to move your layer. Select

---

the Rectangle Tool (R) and then draw a rectangle. Move the layer upward. Use the black arrows on the top to move your layer. Select the Ellipse Tool (L). Draw an ellipse in the selected area. You can also use the black arrows on the top to move the layer. Use the Black arrows to move the layer.

One of the biggest struggles I have with my blog right now is getting out the posts from the last couple of weeks – regardless of whether they are focused on what I’ve been working on or not. I’m going to try to do a better job of making it easier to find the latest post (I hope!) so I decided to start a series of posts over

---

the next couple of weeks. Sometimes I don't want to talk about what I'm working on, but how about what I'm listening to lately? I have a TON of podcasts and audiobooks – nearly 100 subscriptions to my library, plus other random things I occasionally listen to – and I wanted to share a few of them with you. My top three are: 1. Audio Delux I'm always interested in more

---

new podcasts to listen to, so I'm always on the hunt for new ones – and Audio Delux has a lot of good ones. It's a podcast hosted by Adam Curcio, Brian Naimark and Gene Takada – each of them with a different focus (including Game of Thrones, the Pittsburgh Pirates and Formula 1). It's less of an audiobook format than most – more the hosts talking

---

about what they're listening to, plus a little bit of news. My top few episodes this month are: • Game of Thrones • This episode was on The Pittsburgh Pirates, by the way. It's about how fans should respond to trades and other off-season moves. • Lucha Underground: Back To Prison • I found this one by accident – I had an idea to record my reactions to the

---

latest episode of Lucha Underground, but I decided against it and ended up listening to an old podcast of it instead. I really liked this one. They have a strict format: what changes with the show, what changes with the characters, are you excited about these changes, etc. • Formula 1 • This is a solid podcast, but I don't really think it is similar to anything else I'm listening

---

to. • N.O.T.S. • This is another solid podcast. I really enjoy listening to it. • The One on One Film Podcast • This was a podcast I subscribed to originally because I was interested in learning a little

Manipulation of soft and viscoelastic hydrogels by laser-induced thermal flow. This study investigates the

---

possibility of thermal forces, i.e., the creation of temperature gradients by a laser, to induce large deformations or even fracture in soft and viscoelastic hydrogels. The local flow that is generated in three widely used types of hydrogel (poly(N-isopropylacrylamide) and agarose hydrogels, and polydimethylsiloxane, PDMS) is characterized by

---

measuring the flow velocity and temperature by an infrared camera. The temperature, which increases linearly with the laser power, can be varied between the gelation temperature (set by the initial agarose concentration), the melting temperature (set by the final concentration), and the boiling temperature (maximal temperature of

---

about 110 °C). In the latter case, a viscoelastic regime is reached, and an increase in heating rate leads to an additional decrease of the gelation temperature while the critical heating rate is nearly the same for all three gels. The temperature field, which is mainly controlled by heat diffusion in a pure aqueous solution, is more homogeneous in PDMS when compared to those of

---

agarose and poly(N-isopropylacrylamide) (PNIPAM) hydrogels. In this viscoelastic state, the gelation temperature is independent from the heating rate. The flow velocities, which are estimated from the velocity-temperature coupling in this viscoelastic regime, are of the order of hundreds of  $\mu\text{m/s}$ , which is much higher than the gelation velocities

---

reported in the literature.

The poly(N-isopropylacrylamide) gel is a Newtonian fluid and no flow is observed. In the heating of agarose, heating rates between 30 W/s and 80 W/s lead to flow velocities of less than 100  $\mu\text{m/s}$ . Above a critical velocity, a microfluidic regime, where hydrodynamics is governed by the Reynolds number, is observed. Q: Regular
