An Adobe Flash Player A host (or origin server) of multimedia assets is a web server or similar service provider that hosts websites, and video and other multimedia content that can be accessed by users through web browsers such as Internet Explorer, Firefox, Chrome, Safari and others. A Flash Player, a kind of ActiveX component (Microsoft), is a proprietary Java application programming interface (API) which allows developers to use the programming language of ActionScript 3.0 and to embed Flash content in web pages. Flash Player is provided by Adobe Systems. It is installed automatically when installing other Adobe products such as Acrobat Reader or Flash Catalyst. When installed, the Flash Player software enables you to view Flash Player content on the web and also save such content locally to your computer. Adobe Flash Adobe Flash is a cross-platform browser plug-in for multimedia content. It uses ActionScript, a subset of the Java programming language, to create interactive, multimedia experiences (e.g., animated graphics, audio, video, etc.) for websites. Its most common use is in streaming of video and audio content, although Flash can also be used to create games, including games in the browser. Adobe Flash Player Adobe Flash Player is a proprietary software that can be installed on Windows, Macintosh and Linux OS-based computers, allowing them to view Flash content. Adobe Flash Player is a development tool designed for building interactive and dynamic web sites and applications. It is available for most web browsers, and in some instances is embedded in other products like Adobe Reader or Adobe Acrobat. Like any other media file, the SWF file format can also be used to represent other kinds of media, such as animations, interactive art, scientific visualizations, or complex data visualizations. Besides simply uploading SWF files for viewing by web browsers, Flash files can also be uploaded and stored on users' own computers using utilities such as Adobe Flash Catalyst or Flash Builder, or other means such as file managers or WebDAV. Adobe has released a version of Flash Player for 64-bit Windows, titled Flash Player 11.2. In addition, it is also being ported to other platforms such as Mac OS X and Linux. Flash Player 10.2.152.27 is the latest release. An Adobe Flash Player An Adobe Flash Player is an Adobe Flash player that can be installed on Microsoft Windows, Macintosh and Linux operating systems. (Text)Plotter A plotter is an output device used to display data on paper and to draw graphics to support analysis and design processes. Unlike a desk plotter or a plumb bob, plotters include an automatic paper transport to deliver paper to the print head for plotting. Plotter systems are normally integrated with a computer using a serial interface for the computer and graphics plotter system to operate. Plotters range in complexity from non-automated systems, that can only plot by the user, to the highly automated systems used to provide drafts and technical drawing information for the CAD programs. Open Autocad and start the year. Click on the keygen icon on the top left. Select Autodesk. Input the serial number of your drawing as shown in the image. 1. Field of the Invention The invention relates to a process for preparing a substantially anhydrous starch and dextrin product having improved properties for use as a fat substitute. The invention further relates to a food and feed product which includes the substantially anhydrous starch and dextrin product prepared by the process of the invention. 2. Description of the Background The consumption of oil and fats in the United States has been steadily decreasing over the past several years. Concurrently, a trend has also been observed toward the increase of the use of starch and dextrin based fat substitute products, particularly those products which are low in fat content. For example, fat free food products and fat free soups, both of which are currently popular because of health concerns, are often made with starch or dextrin based fat substitutes. While products made with starch or dextrin based fat substitutes do not contain oil or other fats, they are generally inferior to those made with natural fats and oils in both the mouth feel and organoleptic properties of the finished product. It would be desirable to be able to replace the natural fat or oil, especially anhydrous natural fats and oils, in the finished product with a starch and dextrin based fat substitute to improve the mouth feel and organoleptic properties of the finished product. Unfortunately, while starch and dextrin based fat substitutes have been able to achieve a lower fat content than that achieved by previous fat and oil products, they still have a fat content which is higher than that of natural fats and oils. While it is known that aqueous gelatinized starches can be used as fat substitutes, the products thus prepared often suffer from a strong gelatinous mouth feel. This is especially true when the starch based fat substitute is at the lower end of the starch/dextrin fat substitute range, that is, when the final starch and dextrin fat substitute product has a starch content of about 5 to about 25% by weight of the final starch and dextrin fat substitute product. Thus, it would be desirable to be able to prepare a starch and dextrin based fat substitute product having a fat content which is substantially lower than that of the natural fats and oils which are being replaced. It would also be desirable to be able to prepare
