1. Technical Field This invention relates generally to a means for converting an electrical power signal to a fuel-air mixture for fueling an engine to produce a torque to drive the vehicle, and more particularly to such a means that combines a fuel-air mixture into a single-phase electrical signal and then produces a second single-phase electrical signal corresponding to such fuel-air mixture.

2. Description of the Prior Art Fuel-air mixture is typically delivered to an internal combustion engine in the form of a two-phase electrical signal where a first phase component represents the air and a second phase component represents the fuel (as well as the additives). Fuel and air (or oxygen and fuel) are delivered to the engine as separate streams

which mix at a preselected location, commonly referred to as the injector, to form a combustible mixture. The amount of each of the two phases, i.e., air and fuel, delivered to the engine is critical and the air-to-fuel ratio (A/F ratio) may be varied within a certain range to control the speed of engine operation. That is, a more air/fuel mixture produces higher engine speed, but also produces a relatively higher level of pollutants, while a less air/fuel mixture will produce a relatively lower level of pollutants
