What is a backdoor trojan? Definition: A backdoor trojan is a computer virus, worm or worm-like program that allows unauthorized access to a computer. Backdoor trojans are malicious programs that are designed to be stealthy, so that their owner will not be aware that they are on the computer. When the owner is aware that the virus is on their computer, the owner will usually delete the virus immediately. However, most backdoor trojans are hidden by other programs that are legitimate. When the legitimate programs are launched, the backdoor trojan is launched at the same time. There are two types of backdoor trojans: -Keyloggers: these trojans record a user's keystrokes and passwords. The data is then sent to the hacker, who is often located at a different location. Keyloggers allow a hacker to spy on the user. They can steal sensitive data, such as banking information, and they can use the information to commit credit card fraud or other crimes. -Downloader: this type of trojan allows hackers to access files or download additional malware onto a computer. Symantec.com - Backdoor trojans: Fighting back to protect your PC While computer viruses and trojans, such as the ZeuS worm, are relatively easy to spot because they attach themselves to specific files, backdoor trojans are much more difficult to detect. They are not always injected into files. Instead, they are hidden in the computer's startup files and other legitimate files, such as a library file or the Windows control panel. This makes them harder to detect, because they are usually hidden in seemingly harmless, legitimate files. How to protect your PC from backdoor trojans If you want to protect your PC from backdoor trojans, you need to use malware protection software. The software will scan your PC to find any files or processes that contain backdoor trojan code. If it finds any suspicious files or processes, it will alert you so you can take the appropriate action. If you are concerned that your computer might already be infected with a backdoor trojan, you should remove any threats or reinstall your operating system. How to remove backdoor trojans If you suspect that a

IRCbot.KD Remover

This is a new version of the IRCbot.KD. It is slightly improved with new functions. When you launch this malware, it gets infected by all the IRCbot.KD variants. The malware uses a simple technique to connect to the internet. It tries to connect to the port 22 (ssh). If it is not able to do this, the malware connects to IRC. If the connection is successful, the malware starts the IRC process. After this, it sends a message to a known IP address and then the bot begins to spread the worm. Remove IRCbot.KD from the PC: Please follow the given instructions to remove IRCbot.KD from your PC. In order to uninstall the malware, please use the "Windows" menu of the control panel and then search for IRCbot.KD and delete it.
