. The gastrointestinal and liver manifestations of leptospirosis.. Hypoalbuminemia in GERD is generally reversible with acid suppression but is a risk factor for.Progesterone receptor C646 Progesterone receptor C646 (PR-C646) is a progesterone receptor modulator (PRM) that acts by blocking the effect of progesterone by preventing the receptor from dimerising with other progesterone receptors, as well as by acting as a full agonist. PR-C646 is a candidate for use in contraception, and was being studied in a phase III trial. PR-C646 acts by targeting the progesterone receptor in a number of different ways. The drug acts as a competitive antagonist of progesterone, but it is also described as being a non-competitive antagonist. At a biological level, the result of this appears to be an increased concentration of the progesterone receptor leading to increased levels of progesterone target genes. It has been described as being a high-affinity antagonist of progesterone, and it has been suggested that this is the main mechanism of PR-C646. In addition to blocking the action of progesterone, PR-C646 also acts by binding to the progesterone receptor in a similar way to progesterone. This mechanism is not completely understood, but it has been suggested to be the same as that of a "patch" drug. It also acts as a full agonist and occupies the same site in the progesterone receptor as progesterone. It has been suggested that the partial agonist activity of the drug may be of importance to the suppression of the endometrium. A: Your solution (RUN get-asn1) is incorrect, if the version of asn1cmd.exe you are using isn't the latest. First, to get the version number you need to do something like this: $ asn1CmdVersion If you get an output like this (it's different for everyone): R: 00.00.11.00 2068853420 1 12/30/2012 16:18:30 (apparently it's been a while since the archive was updated) you need to update to the latest version. $ wget -q $ unzip asn1cmd-v_0_0_1_3301.zip $ unzip asn1cmd-v_0_0_1_3301.zip $ (asn1cmd.exe -V) A: You were very close but you're only printing out the last subarray. You need to print out the whole array. This will work, assuming you have line breaks (aka line feeds) in your output. foreach (var result in str.Split(' ')) { Console.WriteLine(result); } Console.ReadLine(); You can also use string.Join: foreach (var result in str.Split(' ')) { Console.WriteLine(string.Join("", result)); } Console.ReadLine(); (or better yet, you could use string.Join to just chop off the last line feed at the end, as suggested in this answer) Change Log ========== Version 0.1.5 - 2013.08.24 * fixes issues with string encoding for utf-8 strings * clarified json.Unmarshal definitions * added some additional documentation Version 0.1.4 - 2013.08.03 * fixed JSON field names validation to allow PascalCase json names * added script.Uint types * fixed data, text and codegen error generating * improved data generation 570a42141b
