\*\*\*\*\* The UMPC Display Emulator allows you to execute your application at the UMPC display resolution of 1280x800. In addition to its helpful features, the UMPC Display Emulator can be used to confirm your application is legible and accessible. The UMPC Display Emulator is not a hardware emulator or a virtualized operating system. It is a Microsoft software development tool created by software developers to make it easier to design programs that are compatible with the UMPC's

---

1280x800 display resolution. You can use the UMPC Display Emulator to provide quick feedback on your application's legibility and accessibility in a short period of time. The UMPC Display Emulator simulates the UMPC's display hardware using Microsoft Windows Display Driver Model (WDM) user-mode functions and interfaces. This method is designed to resemble the Windows user-mode API's Device Context (DC) functions of a physical display adapter. The

---

UMPC Display Emulator also provides screen layout functions similar to a physical display adapter. The UMPC Display Emulator supports all of the logic that a physical display adapter provides. It does not provide a way to change resolution at runtime or to configure advanced display settings. Therefore, if you want to use the UMPC Display Emulator to confirm that your application will be visible on the UMPC's 1280x800 display resolution, you should first generate a 1280x800

The UMPC Display Emulator was designed to be a single emulator that can run Windows Mobile 6, Windows Mobile 5, and Windows Mobile 4 applications. You can run multiple simultaneous display/screen captures and you can combine screen captures from different applications to create a hybrid multimedia experience. Also, you can create custom visual styles and it provides a mechanism to make a screenshot's area a live

---

interactive element of the application. Microsoft UMPC Display Emulator allows you to combine the information from multiple display captures, and show them simultaneously in your notebook. This makes it possible to preview your work in multiple devices. Microsoft UMPC Display Emulator contains a standard emulator interface allowing you to emulate all the touch and display features available on UMPC devices. UMPC Display Emulator is a software version of the back-

---

end interpreter that is used to create the virtual display screen capture and is not intended to run applications on real UMPC devices. The UMPC Display Emulator is a pre-built software application with a set of keyboard shortcut, command-line options, and visual styles. Microsoft UMPC Display Emulator allows you to emulate the behaviour and visual appearance of any Windows Mobile device. You can select the style of the emulator screen, the touch screen elements, and the

---

application graphics. The emulator can emulate both the five generation of mobile devices, as well as the 7- or 8-inch widescreen tablet. You can use the screen capture tool to capture the surface of the screen in an alpha or transparent pixel format. Microsoft UMPC Display Emulator can capture the full screen and show you the current window. Windows Mobile 6.x applications are compiled to native code, allowing them to be run without emulation on Windows 7 or Windows Vista.

---

UMPC Display Emulator works as a standard emulator for Windows Mobile 6 applications. Once Windows Mobile 6.x applications are converted to native code, you can run them on Windows Mobile 7, Windows Mobile 6, and Windows Mobile 4. The UMPC Display Emulator is different from the screen capture, screen recording, and screen sharing tools. The screen capture and screen recording tools allow users to capture and share their screen session. The screen capture tool is

---

enabled by default. You can enable and disable the screen sharing tool. The default settings are selected to avoid annoying other users or breaking your personal privacy. You can also easily configure the UMPC Display Emulator to reduce screen capture times and to deactivate screen capturing when the application is inactive
