The History of Photoshop Photoshop was created in 1989 by Thomas Kinkade, a then-young technical illustrator who was working for the noted software maker Adobe. He created Photoshop after finding the piece of imaging software that he found to be insufficient, and made improvements to it. To market his product, Kinkade worked on a plan to mass produce a brochure to distribute to various marketing firms. To help out Kinkade, another Photoshop user named John Knoll suggested using a graphical user interface as opposed to the command line. Kinkade, who had been working with computers since the early 1970s, was excited by the idea of a graphical interface and even made a prototype by hand. The early prototype was named Painter. However, Thomas Kinkade wanted it to sound like Photoshop, so he started calling it "Photoshop Lite." The name stuck. Mac users who were paying the entrance fee of \$299 for Photoshop CS2 could buy a version of Photoshop that was specifically designed to run on the Apple Mac computer. Macintosh users had initially been promised a true Photoshop on the Mac, but when Photoshop CS2 was released in October of 2000, it was simply a half-way point between Painter and the Windows-only version of Photoshop. When Windows users paid the regular price of \$299, they received Photoshop and the Photoshop CD, which came with Painter, as well as a 30-day trial for Photoshop. After that trial period, the Windows version of Photoshop became available for purchase on its own. Over the years, the line between Photoshop and Painter has become blurred as Photoshop has morphed into both a raster image editor and a vector image editor. Features of Photoshop Adobe Photoshop is an image manipulation and editing program that enables users to create and modify raster images. It includes capabilities for creating vector graphics, but its most important function is image manipulation, producing wonderful effects that can enhance the overall look of a design. Note: This article does not cover the functionality of Photoshop's most recent update, Creative Cloud. For more information, see the Creative Cloud section. In Photoshop, you can perform basic adjustments and manipulations to images. You can easily adjust the brightness, contrast, and other color-specific attributes of an image. Photoshop is a raster-image editor, a type of software that operates on bitmap images. You can apply or change the color of images, and

The International Union for Conservation of Nature (IUCN) and partners have identified almost one-third of South America's original forests to be under threat. Photo by Fraser J. Brown WASHINGTON, Jan. 7 (UPI) -- Nearly one third of South America's original forests is now being lost to deforestation, development and climate change, the International Union for Conservation of Nature has warned. The group of more than 160 countries and other partners have identified almost one-third of the original forests in South America to be under threat, including the Guiana Shield and Amazon basin forests that hold 14 percent of the world's terrestrial carbon, according to a study published in Nature. A United Nations-led effort to describe and map where the world's remaining forests are located is an important first step toward understanding their overall condition and detecting any threats to them. But the assessment's authors say its findings and conclusions are "deficient and flawed." RELATED Chile provides refuge for endangered frogs "The data on forest cover and change in the Amazon are much more extensive and credible than that for the rest of South America," study lead author Michael Behrenfeld, a senior conservation scientist at IUCN, told UPI. "The other countries are simply not covered in enough detail or comprehensively enough by previous research," he added. For example, Brazil's Atlantic forest, which contains the largest amount of forest in the Americas, is relatively well documented, Behrenfeld said, but has a very different ecological structure than the Amazon. RELATED Brazil endorses peacekeeping mission in Congo The analysis, which draws on several sources and was released on the same day as U.N. climate talks in Paris, suggests that climate change is the greatest threat to South America's forests. "Most of the terrestrial carbon in the ecosystem is stored in the vegetation layer," Behrenfeld said. "After tropical forest carbon sink is lost, the ecosystem will turn to another sink -- one that is likely to be much more flammable." The assessment's findings are based on information provided by governments, such as those in Brazil, Colombia, Ecuador and Venezuela. However, it is not complete or officially endorsed by the governments for which data was obtained, which include Ecuador, El Salvador, Venezuela, Colombia, Peru and Bolivia. This invention relates to an all-aluminum forming die for making a rolled structure of the type having a continuous thin strip and more particularly to a forming die used for making a wide variety of rolled products, such as thin gauge sheet metal coils, cans, and rod stock. A large number of all-aluminum rolling operations are being developed today because of (1) the increase in automobile and truck body weight due to increasing attention to safety measures and (2) rising oil prices. Aluminum is also becoming more important because of its ability to save heat in the process of manufacturing sheet metal products. In spite of these advantages, aluminum is not yet widely used because of its lack of good forming properties. This problem will be solved by the present invention. Typically, a can blank which is to be formed into an aluminum can is reduced from a sheet-like shape into a cylindrical shape by mandrel rolling. At present, there are two types of mandrel rolling, a general use and a practical use. The general use mandrel rolling is a method in which a circular blank is formed into a tubular shape by a die having a curved surface which is commonly known as the "hourglass" die. The practical use mandrel rolling is a method in which a given blank is formed into a tubular shape by a die having a flat surface. The general use mandrel rolling is a popular method for manufacturing rolled products in large quantities because it is easier to operate than the practical use mandrel rolling, which is suitable only for making products of a limited size. A typical example of a practical use mandrel rolling is a method of making a can body from a given blank. The can body is held between two die halves, one of which is a flat die, and a pressure is applied to the blank through the die halves to form a can body. In the general use mandrel rolling, the blank is reduced into a tubular shape by a flat die by bending its opposite ends inward and then inward. More specifically, a blank is pressed

between a metal ring, or a square die into a tubular shape, and the outer peripheral surfaces of the blank are rollingly pressed by the metal ring so as to form. Thus, a general use mandrel rolling must be carried out using a circular metal die. On the other hand, in the practical use mandrel rolling, a given blank is reduced into a tubular shape by a mandrel by bending its opposite ends inward and then inward. In this case,
