Tenorshare PDF Password Remover is an easy-to-use application which allows you to decrypt and remove owner restrictions from PDF files in a short space of time. It works with any portable devices and can also provide Mac versions. Best Tenorshare PDF Password Remover Software 2018The present invention relates to a non-volatile memory device and a method of controlling the same.

Non-volatile semiconductor memory devices store information even if power is turned off. NAND flash memory, whose basic configuration is shown in FIG. 1, is well known as a non-volatile memory device. In FIG. 1, a memory cell array 500 includes an upper page buffer circuit 501 for reading data stored in a corresponding page, and a lower page buffer circuit 502 for reading data stored in the corresponding page and supplying data to the upper page buffer circuit 501. The

upper page buffer circuit 501 and the lower page buffer circuit 502 receive an input of control signals $\overline{\text{CPGLn}}$ and CPGLn that are complementary to each other from the outside. A command decoder 503 receives an externally supplied command code CMD to decode the command code CMD that is input from the outside into a write control signal BLP , a read control signal RDP , a bank select signal Bn (which is an internal bank address signal), and control signals $\overline{\text{CPGLn}}$ and CPGLn that

are complementary to each other. The command decoder 503 outputs a write or erase signal BLP, a read signal RDP, and a bank select signal Bn that are decoded to control respective operations. A state machine 504 inputs the output from the command decoder 503 and controls data lines DQm. The state machine 504 generates the write or erase signal BLP, the read signal RDP, the bank select signal Bn, and other internal control signals. The internal control

signals are input to the upper page buffer circuit 501 and the lower page buffer circuit 502, and control data line driving operations. The state machine 504 receives the control signal CPGLn that is output from the command decoder 503 and generates the data line driving control signal PL. The data line driving control signal PL controls the data line driving operation of a selected page. The data lines DQm are respectively connected to the sources of the memory cells in the page buffer

circuits 501 and 502. The data lines DQm are connected to data buses DBm to which a corresponding data line is connected by a bit line decoder.
