proximal part of the first part of the duodenum. Intramural injections of the radioactive preparations labelled with the substance of lability Ki-67 were made to localize proliferative activity. The investigation showed that the majority of the patients

suffering from gastroduodenitis exhibited severe dystrophy of crypts. In 27% of the cases, mucous epithelium was replaced by the goblet cells. In 12% of the specimens, in the wall of the duodenal bulb, hyperplasia of glands was identified, they were characterized

by prominent atypia and by expression of a proliferation mark er. Microorganisms, particularly bacteria, constantly present a threat to infants, children, the elderly, and others that are susceptible to infections. It is useful to have a method for killing microorganisms that

is cost effective, readily available, and which does not cause collateral damage. In the past, chlorine gas, hydrogen peroxide, ozone, and permanganate have been used in the home for making swimming pools and spas safe for bathing. Spas and pools are often

contaminated with micro f30f4ceada
