Visual Schema is not limited to the structure of a database but can be used to illustrate many other types of data: Data Base Diagram. The database tables and columns, views, stored procedures, triggers, etc are all put in place for you to illustrate it on the screen. The software is not only used to build a graphical database diagram but also to produce an array of diagrams that allow you to view the database from different aspects and have easy access to the structure of the database: Rollup - This shows you the structure in a summary manner (with just a list of tables), a general overview of the data base. With the Rollup option, you can also use the Filter command to find the tables/columns that you wish to visualize. When you click on a table/column, Visual Schema will only show it and all the other tables and columns that it depends on. In the rollup mode, it is possible to customize the data to be shown by clicking on the plus, minus buttons next to the table. This operation adds or removes tables/columns from the rollup. Multiple diagrams Visual Schema allows the creation of multiple diagrams by passing a directory or folders containing a large number of tables and databases. All the diagrams produced by Visual Schema can be managed in a single window: you simply choose the folder you want to load, then the operations you wish to perform (Show/Hide) are done. From the left, the operations are: Show Folder Hide Folder Show Selection Hide Selection Generate Diagram To make these operations effective, you can choose the menu's: Show/Hide With the Show/Hide option, you can choose either all or part of the diagram to be visible or not.
