PCalc is a program designed for Windows that features excellent capabilities to perform a variety of mathematical calculations, averages, percentages, and even dimensions. This utility excels in scientific applications and functions and will quickly become one of your most frequently used programs. PCalc has a flexible formula interface that allows for quick and easy calculations, and the program has an array of other features that will

---

keep you coming back for more. There are time periods you can format the result of a formula to make it look more professional. You can also perform translations for numbers and various units. Besides, there are numerous ways to save formulas so you can perform them easily without having to constantly re-enter them. Users can also get access to a full color ruler to make measurements more precise and easy. PCalc has a wonderful application that allows you to solve simple math problems.

---

Moreover, there are two different designs to choose from: wizard style and the regular style. And last but not least, all your results are memorized to come back to them easily. Being able to read what your mistakes are and where you went wrong with a calculator is always handy. PCalc does this very well as you can see graphically where and how you got to a specific result. It then shows you the formula you used so you can easily find where and how it should have worked out.

Invention The present invention relates to a semiconductor memory device, more particularly, to a device for reading and/or writing information to/from a memory cell array.

## 2. Description of the Related Art

To date, various kinds of memory devices have been proposed, such as a volatile memory device and a non-volatile memory device. In general, semiconductor memory devices are classified into a volatile memory device and a non-volatile memory device, according to

---

whether they lose the stored data when a power supply is turned off. Examples of volatile memory devices include a dynamic random access memory (DRAM) and a static random access memory (SRAM). Examples of non-volatile memory devices include a magnetic memory device, such as a magnetic random access memory (MRAM) and a ferroelectric memory device, such as an FRAM, which can retain the stored data even when the power is interrupted. A static memory cell of a DRAM or

---

SRAM needs to perform a read operation after a word line and a bit line connected to the static memory cell are precharged. In this case, however, if a word line or a bit line is disconnected due to a noise, a short-circuit, or the like, the precharge operation is performed at the time of precharge, thus causing a reduction in the precharge margin. Therefore, a refresh operation for the static memory cell is performed, which requires a relatively long time to restore the precharge voltage.

---

Meanwhile, a DRAM or an SRAM operating with a reduced voltage can control operation of a static memory cell by directly applying a cell voltage to the static memory cell without precharging the word line and the bit line. However, in this case, since the memory cell is not restored, data may be lost. To solve the above problem, for example, a spare column selection line is connected to a non-selected word line, for preventing a word line from being deactivated. The spare column selection line is also

---

connected to a dummy memory cell, which serves as a substitute for the memory cell affected by the noise, the short-circuit, or
