Star Wars: Rebellion is a game on the Jedi Star Wars series of video games. It is developed by Visceral Game Studios and published by Atari. Gameplay It is a Star Wars video game, in which the player has the task of leading his team of four or five characters against enemy forces, until they reach the end of the game. It is based in the legendary starship, the Rebellion, upon which the player will control the four or five crew members. The highlight of the game is that it is the first Star Wars game to be developed in a 3D environment, and for this reason it provides a lot of opportunities for exploring and developing the environment. The game takes place on board of the Star Destroyer, pursuing the enemy's fleet. Plot The main objective of the game is to destroy the Death Star (second planet) and destroy Darth Vader. To do that, the player has to destroy the reactor and the ship that protects it, while defending the "mother ship" (the "rebel base") with the shuttlecraft. The game ends when the player is the last character to find the Death Star's reactor, but players can control the character of their choice through the game. The game is divided into three scenarios. The player can access any given scenario by controlling the spaceship with the "W" button and directing the characters by using the "A" button, that is by selecting one character, followed by an action. In the game, the player can communicate with all characters by using the "C" button. The characters have different skills, including "jetpack", the ability to enter and exit the shuttlecraft without the need to engage the thrusters. This technology makes it easier to leap and orbit the planet. Characters The game allows the selection of up to four characters. Players can choose their characters after the challenge has been started, but they are locked in until the requirements have been met. The time that passes between the previous character being used and the player can select another is fixed, regardless of the choices of the characters during the game. The four main characters are: Darth Vader, Luke Skywalker, Han Solo and Leia Organa. The names of the rest of the characters are not revealed. Additional information: Star Wars: Rebellion is based on the Star Wars universe but is not a traditional Star Wars game, since it was not created on the basis of a specific movie, but from

Computer vision was born in the mid 70s, in a field known as 'computer vision', as it was called then. The early vision tools were created by people such as Steve Mann and Ben Mallick, both research scientists with great competence in biology, chemistry, and mathematics. Some great vision researchers from the time are: - I. Bernard Cohen - Doug Lindeberg - Roger Ramon - Constantine Zachos - Jacob Cohen - Heinz Hoffmann - Marcel Wallner - I. J. Dan They worked in the COOP Research program, and wrote some of the early research papers (others were written by Daniel C. Duvsau and Eugene B. Livne). This short history shows what kind of vision researchers they were: - they had interest in biology and chemistry - they were excellent mathematicians - they had good experience in industrial applications of their vision research (the VIYON product). As more and more people became involved in vision research, by the late 80s and early 90s, there were many academic groups around the world working on vision. These groups were mostly centered in the United States, with researchers there and a few Canadian vision research centers (I wish this report was more accurate). The level of activity in the field peaked in the mid 90s, and a number of vision research centers sprung up around the world, starting with the pioneering centers in Japan, Germany, Canada, and later the Netherlands. The most well-known of these early vision research groups in the United States were the Center for Computer Vision and Robot Vision, the Visual Computing Research Center, the Laboratory of Computer Vision at MIT, the MIT Media Lab (VPL research group), the Center for Vision Research at the University of Rochester, and the Pitt Vision Center at the University of Pittsburg. As vision research became more active, a number of academic societies sprung up and became influential. One of these was the IEEE Computer Society Computer Vision Technical Committee, which held its very first conference in 1991, with 73 papers, 42 invited and 31 submitted. The field itself also started to gain more attention from industry, with many commercial products coming out of the 80s and 90s, which were developed with the help of the original vision researchers. The first was VIYON, by Mark Ross a top researcher at the MIT Media Lab, which was introduced in 1987, but did not really become successful until the early 90s. Many other products appeared,
