Designers use AutoCAD to create 2D and 3D models of buildings, machines, and other components. AutoCAD is a computer-aided design (CAD) application that is available in desktop, web, mobile, and IoT editions. The software is optimized for use on personal computers (PCs), and most major manufacturers and users of commercial-grade 3D modelling tools rely on AutoCAD for their 2D drafting work. AutoCAD is known for its professional 3D modelling features and its ease of use for new users. AutoCAD lets users create both 2D and 3D drawings by connecting to various types of files and rendering them into 2D layers. AutoCAD is a commercial application, with AutoCAD 2017 costing around £ 1,300, whereas AutoCAD LT is a non-profit and free version of the software. Basic features of AutoCAD, non-technical artists used a variety of "graphics programs" that allowed them to create drawings in two dimensions. To create a CAD drawing, however, a user had to connect to a graphics workstation, such as a plotter or computer-aided design (CAD) program. AutoCAD to design mechanical components. AutoCAD to design mechanical components, but it does not include many other functions needed to create architectural, civil, or landscape drawings. CAD programs typically use point, line, and polyline commands to draw objects. The drawing environment in AutoCAD is divided into a 2D and 3D environment. Once a file is created, the user can add text and dimensions to create a new drawings. The user must manually draw the text and objects they want, which can be time-consuming for complex drawings, including a perspective

RADAR is a third-party AutoCAD plugin that helps in the conversion of AutoCAD DWG drawings into SketchUp format. From version 16.0 the xref contains all the information which can be used to build a 3D model of an architectural drawing. In this case, the AutoCAD xref is used as a template for the creation of the new object using an existing 3D model. From version 16.5, the xref can contain text, contours and surface data. The xref contains all drawings and blocks which are based on the selected layer. The XRef may be printed and annotated, although this functionality is not widely used. Let's say I have 3 async tasks that I want to run and I don't know when they will finish. How do I wait for all 3 of them to finish? I found some answers that use a static function to set the cancellation token on each task, but I don't like that solution as I can't cancel it easily without having a class? A: You should avoid sharing a single token across multiple tasks. Tasks can be cancelled during their execution and the cancellation handlers will be invoked immediately, which may lead to inconsistent behavior if cancellation Token. Register for each task instead, you can specify the token to be used by the task and control the cancellation based on that token. The first task that has its token set will use the token and will then set the token for the following tasks. After all tasks have been set, the first task will be valid for multiple tasks.
