G protein coupled receptors (GPCRs) play a pivotal role in the transduction of extracellular signals. This is exemplified by the discovery of G protein coupled cannabinoid receptors, the first GPCRs to be discovered (Mihic et al., Nature 1990, 346, 647-650; Bracher et al., Biochem. Biophys. Res. Commun. 1992, 185, 909-915; Gombori et al., Eur. J. Pharmacol. 1993, 231, 195-202). A variety of studies in recent years have also shown that cannabinoid receptors are present in the brain, both in high abundance and in distinct sub-cellular regions (Pertwee, R. G. Brain Res. 1999, 832, 192-195). Thus, these receptors modulate the effects of exogenous cannabinoids by mediating the effects of endogenously produced cannabinoids. Specifically, cannabinoid receptors are found to modulate neurotransmitter release, for example, by modulating vesicular release of glutamate, dopamine, GABA, acetylcholine, or serotonin (Pertwee, R. G. Brain Res. 1999, 832, 192-195). As a result of the interaction of cannabinoid receptors with exogenous cannabinoids, or with exogenous cannabinoids and the endogenous cannabinoid anandamide, modulation of neurotransmitter release by cannabinoids has been shown to occur through presynaptic (pre-synaptic) and/or post-synaptic (post-synaptic) mechanisms (Mackie, P. Drugs 2001, 61, 125-128). Presynaptic modulation by cannabinoids is mediated primarily through cannabinoid CB1 receptors, while post-synaptic modulation is primarily through cannabinoid CB2 receptors. It is now also believed that there are also cannabinoid receptors that are independent
