Automate media file transfers with Anomos, the world's simplest and most anonymous torrent client! Easily set up and start to transfer your favorite movies, music, and games. The application doesn't make any connections or compromises your privacy. Simply use the folder you want to send files to and you're done! What is this thing, exactly? Anomos is an app to send files, and the main reason why is because this software doesn't require any connections and even anonymizes the complete process. It comes with a file scanner and an open dialog, both of which make the whole process easy and fast. Scan for torrents and load them up with your desired files Just like other BitTorrent clients, Anomos has a few main functions, such as searching, adding, importing and downloading. The home interface is extremely plain, and you'll have to use the full screen version to get anywhere else. The file scanner comes up automatically when opening the app, and is only required one time. It automatically scans for.torrent files in your chosen folder, and places a pending option in that huge space in the center. If you've decided on a torrent, just select it and it's time to add it. Once selected, the torrent is automatically placed on your computer. If, for some reason, you aren't sure where it is, then it's time to load it. Just select the file and click open. Once the torrent is loaded, you'll see a list of your files in the preview. Simply drag them into the.torrent container in the center and Anomos does the rest, not requiring any special instructions. Once all files are done, simply click the green "Add files" button to begin the process. As we mentioned earlier, one of the main features of Anomos is that it will anonymize the whole process, making it very unlikely you'll be detected by any spyware programs, such as anti-virus software. If you've used a P2P file sharing program before, you'll have a good idea of how this program is set up and how it works. Select the files you want to send Anomos keeps everything incredibly simple, as mentioned earlier. The whole function of transferring files begins with selecting the files you want to send. Like most P2P
