Antiope-1 creates Auxbus machines from an MIDI input using the FFT and Frequency domain operations. Antiope-1 features: - monophonic Auxbus Machine - Taurus-4C LFO - aux-to-MIDI converter (transfers MIDI in to a side-chain signal) - Side-chain signal can be muted - Envelope follower - Filters (low-pass, band-pass, high-pass, notch) - Saturation (with the resonant low-pass filter) - Counter that counts from the beat of the main signal. Very useful for timing If the bank is too low the waveform disappears, if it is too high it won't get in sync with the main signal - adjust bank. + V-Synth II effects now include the OSCiL with the BeatV-Synth-OscControl module, and many new V-Synth II effects have been added. An OmniPolysynth emulation toolbox-designed for live-use over MIDI, with both FFT and analog-type processes. Originally developed by the FreeJazz FPGA Project and the Creative Studio soundlab at the Royal Conservatory of The Hague. No previous experience is necessary. Compatible with FFT/FFE/FFD, FMSynthesizer, XRack, and many other synthesizers. Most current synthesisers can have the oscillator - and all current FFT synthesizers - modulated by the suboscillator. In this synth, we give you a direct control of the sub oscillator. FFT LFO - (made in the bitblote area) FFT LFO is a free Oberheim FFT oscillator LFO. A squarewave LFO, similar to the Oberheim Polyphonic Speed. FFT LFO provides amplitude modulation via the mod envelope. Control: Oscillator 1 and LFO (amplitude) Compatibility: FFT/FFE/FFD, FMSynthesizer, XRack and many other synthesizers. The FOSC are oscillators with modulation side-chains. They can be used in most monophonic FFT synthesizers. They can even provide a /patchable guitar-like FM with the FOSC modulation side-chain. They can even be used as an external effect! Mix

Antoine 3 is a very powerful audio plugin. It's famous for it's filter emulation, but it's also been found to be very useful for numerous other things. Antoine 3 is my attempt to take a filter and amplify it for the lower frequencies. Antiope 1 is a similar little plugin that allows you to do the same with the sidechain, but on a more limited scale. Antoine 3 Filter Definition: This filter is set up in such a way that low frequencies are cut off at frequency 1/2. The resonance is at 75% and the cut-off is at 0.5. The graph above is the spectral display of the filter. Antiope 1 Filter Definition: This filter is a much simpler version of the filter from Antoine 3. Instead of having a cut-off at 0.5 this one has a cut-off at 0.25. The spectral display above is the same as the Antoine 3 filter. What can these two plugins be used for? Probably a lot of things. From letting you amplify all of the lower frequencies to cutting of the lower frequencies completely. This is the second version of my sidechain crossover plugin. This version allows you to control the width of the crossover by scrolling the knob. Needle crossover. This consists of an FFT spectrum which switches to the sidechain when a needle goes down. I hope you like it! Hi, Antoine here and happy to see another plugin related to Auxbus in the VU meter world. I'm glad you like the plugin. I'm not really a DSP guy, I just create what I want to have, a plugin in this case. I tend to avoid the API because it's not free and I'm lazy. If you want to implement it I'm more than happy to help you. As for the name, the plugin is directly inspired by the famous C64 "antilope" plugin. Sorry for not being more b7e8fdf5c8

The Electromyograph modulation signal on Auxbus is close to perfect, even if you really respect to the characteristics of the aux input and of the audio signal. So using the auxiliary signal it is possible to control many parameters of the Music by modulation. The Antiope-1 is a plugin that allow you to drive modulation using Aux. - It's main purpose it's to allow you to drive modulation by an auxiliary signal. As aux input, it can works with many standard devices of system (sound card, whatever you need). It includes FFT functions on your Aux as well. Using the transformation in frequency domain, you can do many things: 1. Low frequency modulation of your audio signal. 2. High frequency modulation of your audio signal. 3. Add modulation in frequency domain 4. Add modulation in time domain. 5. Percussive effects of modulation in time domain. 6. Apply compression on modulation signal in time domain. - Note: you can apply any kind of compression. 7. Selecting the size of modulation - Notes: if you select a small modulation effect, it is very easy to notice modulation. - In the default configuration, the modulation is about 0.5db - You have an "auto" option that allows you to adjust the modulation according to your needs. 8. Do rapid modulation with little transient 9. Do modulation with pedal of audio buffer, so you can got a period modulation. 10. Control AudioTap with modulation signal 11. Modulate Pitch of your keyboard. Antiope-1 Documentation: to get more info about Antiope-1, please visit the site: For more info: #Antiop-1 Flanger

Antiope-1 is a small sidechain plugin that lets you control the modulation depth of the sidechain signal from the main output device. It provides side-chain modulation capabilities for the forthcoming side-chain beta of LADSPA modules such as fxpmp and r3. Its purpose is to make modulation more interesting and useful in side-chain modulation applications. Take this on a test drive and be creative. Antiope-1 Features: simple Clear side-chain volume and output from 0 to 100% continuously. Can be applied side-chain plugin with LADSPA plugins as most plugins. Use Antiope-1 as the loop buss. Antiope-1 is originally written by pc More Info: PC Site: Antiope-1 Plugin: Video: Place a download request for Antiope-1 here: Microphone Filter Antiope-1 can operate as a soft mic preamp as well. Antiope-1 Call For Developers: Each side-chaining plugin requires an optimization routine to achieve maximum possible performance. LADSPA plugins from pc and other music softwares typically have high CPU utilization. Antiope-1 has been written with this in mind and the results are really good. The audio performance is best if four or more cores are used and 32 bit float and integer data is used throughout. It is easy to set this up, just supply a rate or wav file and the rest is magic. Antiope-1 is a fast producer of audio, More Info: PC Site: PC Wiki:
