The basic AutoCAD command line interface (CLI) includes the general-purpose commands: g (goto), l (load), m (measure), n (new), p (print), r (redo), s (save), t (text), u (undo), and w (write). The CLI can be entered interactively by pressing "Enter" at the command prompt, or automatically by pressing "c" from the command line prompt. There are two command-line shells: The CACLS shell, which is accessed through the command-line or AutoCAD programming language by using the command "cacls". (cacls is a macro, or function, which translates a string, or a list of strings, such as "C:\autocad", into the appropriate command. The "cacls" macro replaces the "cacls" function). The CONTS shell, accessed through the command-line or AutoCAD programming language by using the command "consts". The CONTS shell is used when the program needs the user's input. (It can be used in its own right, but it is also useful as the basis for executing commands with custom options or default settings.) The command "cacls" lists the users and groups in the local system. The "consts" command includes two parameters: the default value, and the default value of the last statement. Using the "consts" command with the parameter "s" allows you to record the values used last time. When you replay the command with the same parameter, the command will replace the recorded values. Using the "consts" command with the parameter "t" allows you to record the values used last time. When you replay the command with the same parameter, the command will replace the recorded values. Automation can be done in a Windows Command Line or using the program's API. The Windows Command Line provides a command named "echo", with options, allowing you to type and run a block of statements or commands. The API allows you to run programs from within the program itself, or to use the API functions to control the program in which they are running. AutoCAD 2012 offers a scripting language named "AutoLISP". It is a high-level, interpreted, multi-paradigm, Lisp-like programming language that extends the capabilities of the command-line, objectARX (formerly ObjectARX ca3bfb1094
