Automation CAD can be used for automation purposes to generate drawings or to create, update, change or delete documents or objects. It allows users to create CAD workflows to automate the assembly of drawings, processes or other tasks. In fact, the term automation is used to refer to almost any software application that produces work or output based on input. SketchUp has built-in functionality that allows users to set up a workflow. Similarly, Autodesk SketchBook Pro and Inventor 2012 allow the creation of textured spheres and gears. The process of defining automation functionality is called scripting. Scripts are used to automate repetitive tasks (referring to a task or activity that can be done by repeated operations), minimize user interface (UI) controls, minimize user input and to create tools. For example, scripts can be used to automate tasks such as building a house by creating a set of requirements and scripts to build a house. Automation is based on the concept of a workflow and the various components of a workflow define what a user will be doing in the system. An automated workflow would be a CAD-based workflow that would generate a 3D model of a house, then further develop it into the architectural plans. A more complex workflow would require a combination of design and automation. Autodesk Revit Architecture provides a set of tools for working with automation in Revit, including the Autodesk IntelliTrace automation trace profiling technology. Slideshow (3 images) Britain's biggest train drivers' union, RMT, blamed the government for increasing ticket prices, even though fare rises are recommended by the Office of Rail and Road.
