Transformers - Overview Achieving "breakthrough" performance with aircraft gas turbines (A&G T) may require a complete overhaul of gas turbine technology, says federal agency chief. The issues afflicting A&G T will soon be dwarfed by a much larger challenge. It's the steady march toward the factory of the 21st century. When Boeing decided to replace the 747 jetliner with the 777, a new type for a new generation of airlines, it tossed aside decades of technology development, said Judith Kertzman, A&G T program manager at Boeing Commercial Airplanes in Renton. The new model may even be built on a new platform, such as the advanced 777X with a mid-body fuselage, but the aircraft wouldn't look different. No radical changes are in store for the 747 jumbo. In the next few decades, Kertzman said, we are likely to see similar breakthroughs in the evolution of components such as engines, combustors and gas turbines. This trend toward compatibility will eliminate the development cost of taking a partially mature component, such as an engine that has been around for several decades, and adapting it to a new platform, she said. As a result, Boeing is preparing the next generation of technology for a new generation of technologies, said Linda Cushing, Boeing A&G T technical program manager at the Seattle plant that builds the 747. "It's hard to predict the whole step change," she said. "It may be as big as the 777, but that's not saying it won't be a step change from where we are today." One of the emerging capabilities will be to manufacture aircraft with different composite materials at different temperatures or for different applications, she said. The shift to emphasis on part compatibility and more rapid response to market requirements makes the next generation of A&G T a revolutionary change, Kertzman said. Composites in Business The new technology is driven by an increasing appetite for lightweight composite materials, which can serve as the fuselage, wings, a wing section, or a thrust wing. The growth in demand is being driven by the confluence of three factors: a surge in the use of lightweight commercial aircraft; the expansion of commercial aviation's international reach and ambition; and the growing use of aircraft as part of an integrated global supply chain, Kertzman said. Adoption of composites in the airline industry
