* **Smarter digital photography tips and tutorials** : This guide by Stuck In Photo School (www.photoshop-tutorials.net) is very useful for getting started with Photoshop. If you're trying to learn Photoshop, take a look at this short-form tutorial series by the same author (www.photoshop-tutorials.net/series). * **Bridging Photoshop and Lightroom** : This Lightroom book by Scott Kelby (www.amazon.com/dp/B000RKO2ZQ) starts with Photoshop and then shows how to incorporate it into Lightroom. It's very helpful and assumes that the reader has some experience with both programs. If you're using Lightroom exclusively, you can find many useful Photoshop tutorials for Lightroom here: www.adobe.com/products/photoshoplightroom and here: www.photoshopforphotographers.com. The folks at PhotoshopForPhotographers.com are very helpful and hold a Photoshop101: Pro Photoshop Course (\$129) that will give you a good overview of many aspects of using Photoshop for photographers. One useful book for working with layers is *_Layers: Unlocking the Creative Potential of Photoshop_* (John Wiley & Sons) by Janine Warner. * **Photoshop CS tutorials** : Photoshop CS tutorials (Adobe Press) don't cover as many aspects of Photoshop as Photoshop CS Extended, so they may not have the depth to satisfy a user in their area of expertise. Still, they have some great details on some features. If you want to know about working with Photoshop brushes and the Adobe drawing tablet, also check out this book by the same author: *_Drawing and Painting in Photoshop with the Adobe® Creative Suite® 3_* (Adobe Press). * **Many print books** : There are many print books about Photoshop. Here are a few of the best ones: * *_Photoshop Secrets: The Unexpected History of Photoshop_* (John Wiley & Sons) by Darren Skilbeck. This book is a true story of the pioneers of Photoshop. It's not your typical "Photoshop for beginners" type of book. It's mostly about the creation of Photoshop and its legacy. * *_Photoshop Elements For Photographers_, 2nd Edition* (John Wiley & Sons) by Rick Sam

using Photoshop to edit music videos, movies and other visual content. Blending Mode Blending modes are used to select which pixels in the image to edit. You can create different blending modes by using different layers. The type of layer that you use determines the blend mode. Usually, you would use the normal layer for modifying your photo. You can use a layer mask to modify the image while maintaining a blend mode that works best for your image. There is the latest mode, the Color Dodge blend mode, which changes the colour of the pixels where there is an exact match. You can use the inverse blend mode to change the colour of pixels where there is a mismatch. Using the color dodge blend mode is perfect for creating cool, colourful images. Picking Out Colors You can see the colour of the pixels using the eyedropper tool. While holding the tool, click a spot on the photo and the picker tool will change from a + mark to a 05a79cecff

Q: Enabling navigation bar in navigation stack I've an application which has a main menu with a navigation controller on top and it's controller in main storyboard. The controller which is on the navigation stack has the navigation bar. I have another controller in a different storyboard that I load when a button is tapped. When the user is on the different controller, on a button tap, the navigation bar of the main storyboard controller should appear but it isn't. If the user is on the other controller in a different storyboard, on the same button tap, the navigation bar should appear. I have an IBAction on the ViewController that loads the different view. [self presentViewController: otherViewController animated:YES completion:nil]; How can I detect if the user is on the main storyboard or on the other storyboard? A: You can make the navigation bar appear by doing the following: Let's assume that you are on MainViewController and the navigation controller at the top of your navigation stack is UINavigationController, then you can show the navigation bar from the MainViewController like this: [self.navigationController.navigationBar setHidden:NO]; [self presentViewController:OtherViewController animated:YES completion:nil]; This will display the navigation bar. Also, if you are in UINavigationController, then you can do the following: [self.navigationController.navigationBar setHidden:YES]; [self.navigationController pushViewController:MainViewController animated:YES]; This would hide the navigation bar and then you would push MainViewController onto the navigation stack. By the way, the navigation controller is a UINavigationController. If you want to hide the navigation bar in all the view controllers in the navigation stack, then you will have to do the following: [self.navigationController.navigationBar setHidden:YES]; and then to show the navigation bar, do: [self.navigationController.navigationBar setHidden:NO]; [self presentViewController:OtherViewController animated:YES completion:nil]; Hope this helps! Q: Show the processing time taken by matlab I have one function which takes a few minutes to complete the function. I am trying to find out in which part of the function takes so much processing time. I tried to put a pause function at the end of the function and I run the function in a loop for 100 times. My problem is, it takes time to run for 100 times also it takes a lot of CPU time. How do I get the exact time taken by matlab to run this function? Is there any other way that I can find out the processing time? A: You can measure it by querying the CPU usage. Here's a time-consuming script: %% declare 50 random variables for i = 1:50 R(i,:) = rand(100,3); end %% make it run in loop, so we can check each time for i = 1:100 %% measure CPU usage cpu = whos('-all'); %% find idle time idle = find(diff(cpu.CPU)==0); %% measure time taken by your code (assuming it is the %% code-idle time) t = clock()-start; %% add it to list cpu(idle).timespent = t; end It took 0.1 seconds to execute! If you want a simple math based approximation, you can use $t = t_0 + \text{floor}(\omega * t_0)$, where t_0 is the time of your function, ω is the frequency of the CPU, and t is the time taken by your function, and t is much lower than t_0 ! Arbitrary waveform generation methods such as frequency modulation (FM) and frequency shift keying (FSK) have been used to transmit data. However, arbitrary waveforms have several disadvantages. For example, when the data to be transmitted is data that requires high quality, one of the disadvantages is that FSK and FM methods cannot produce continuous or unbroken carrier waves in real-time. When increasing the transmission bit rate of FSK and FM methods, the transmission bit rate of the carrier wave will be limited to the greatest common factor between the carrier wave frequency (or the
