AutoCAD Architecture – 6 levels AutoCAD Architecture The layered architecture of AutoCAD enables the creation of complex, high-level documents from a simple sketch, and documents can be reused as needed by other designers, even if they are not users of AutoCAD. This is achieved by means of three independent layers: the design level, the application level, and the presentation level. Design level — The design level or model level contains all of the elements (dimensions, objects, and styles) required to create a drawing. The model level can also be thought of as a collection of sublayers (stored in the drawing's ViewLayer). Each sublayer represents a distinct facet of the design. — The design level or model level contains all of the elements (dimensions, objects, and styles) required to create a drawing. Application level — The application level is an abstract description of how the design is to be rendered or displayed. The application layer provides the means to convert the model and view levels into graphics, sounds, and images. — The application level is an abstract description of how the design is to be rendered or displayed. Presentation level — The presentation layer is the software interface for the end user, which enables them to view the design as it will look when rendered on the screen. The presentation layer is often accessible via a graphical user interface (GUI) or a command-line interface. Autodesk began to develop AutoCAD in the early 1970s, inspired by Simula 67. The first public release of AutoCAD in 1982 was on a DEC VAX minicomputer running the first version of the VAX-11/780 operating system. From 1982 to 1986, the original AutoCAD used the Draw and Links layer model. In 1986, the user interface underwent a major revamp with the introduction of 3D graphics, color imaging, and font technology, and AutoCAD became a universal application. This era is known as the "classic era" of AutoCAD. Key features of AutoCAD Autodesk AutoCAD provides the following features: • Architecture
