Distribution..Q: How to
reference a linked image in a
font glyph? I am trying to write
a custom unicode font that
includes some special

characters. One of these characters is a person holding a sign. Normally, a person holding a sign would be represented by a person with arms hugging the sides of the font. For this particular character, it would be better represented by a crescent moon with a box around it (see below). If you have a font, like Arial, that includes the "person with arms hugging the sides of the font", you can right click,

Properties, Open Font dialog, select a font, and there is a line that says something like "Reference Font" and has the reference number, "1.0" for example. The picture in the "Reference Font" line of the "Arial" font says, "From Alexander E.Sessler's 'Arial'"

This dialog allows you to click on the reference number, and an image appears in your Font dialog. This doesn't seem to be the case if I use a glyph in the

font that is linked to an external image. As an example, I have created a Windows font that uses the glyph, and that image is named: sign3.bmp When I click the "Reference Font" line for the sign3 glyph, the "Reference Font" dialog does not have an image window listed like for "Arial". What am I missing to get an image to appear in the "Reference Font" dialog when I reference the

glyph? Thanks in advance for any help. A: Sadly, it is not the case. c6a93da74d
