Comunicacion Serial Pic A Pic Mikroc

i2c or iic or i2c stands for inter-integrated circuit. it is a very popular multi-master, multi-slave serial communication interface developed by philips. i2c uses two bidirectional open drain data lines, serial data (sda) and serial clock (scl) with pull up resistors as shown below. unlike uart, you can connect and communicate to multiple devices using the same i2c bus. hello mr.raj..im a final year student doing the research about green house environment and i need to built the temperature and humidity sensor system for the house.i had purchased the dht11 sensor and pickit.seems the coding using mikroc code.and im using mplab software to transfer the coding into the pic16f628a.i had tried alternative way to upload the hex file of dht11(i download from the given link) and seems it doesnt show any reading of the sensor and lcd shows some garbage data which mess up badly.please do contact me via email as i need your guidance on this matter. the basic premise of the peripheral is that the microcontroller (pic) transmits data to a device (serial port) on a serial cable. the microcontroller is connected to the computer using a connector such as a usb connection or serial connection. this microcontroller has the two pins rs485, tx, and rx. the microcontroller transmits data to the serial port. when the port is receiving data, it automatically will respond to the microcontroller with data. the microcontroller sends data to the serial port whenever you want to transmit data to the port. you transmit data to the port by sending a command to the microcontroller. you receive data from the port by receiving a response. 5ec8ef588b
