I grew up calling it “plastik” (plastic). I was quite interested in it in school. I learned about how much different it was from glass and metal, and how it could be polymerized into one of the most useful substances the world had ever seen. I was 14 when the Second World War started. Plastic was such a big help to the war effort that the British government became convinced that it was such an important material that it should be manufactured in the UK. Eventually, the government owned 100% of the shares of the plastics firm, Plastics Research. The UK’s plastics industry was the biggest in Europe. Over 50% of the world’s plastic in the 1940s was made in the UK. However, this was a very low-tech industry. Most plastic was made from petrochemical. In order to make plastics, you needed to know a lot about chemistry. But they were cheaper than metals, and could be put together quickly. The UK’s plastics

industry struggled in the years after the war, partly because of the devaluation of the pound, partly because it was not as efficient as its competitors in the USA and Germany. And of course, people were moving to the cities for the jobs. There was a constant battle to find ways of creating cheap plastics and making them at a good price, but this is another story. After the war, plastic became a much bigger industry. ff5e5ca8c9
