AMIBCP V4.53 93

furthermore, the majority of the bios configurations for these motherboards follow a set of common conventions that lend themselves to easy parsing and customization, and many options are read from a list file. for example, there's a pci config section that defines various device properties and parameters, and the booting device list is an indexed list file of all the hardware devices the bios finds when booting. all of these bioses have the standard cmos header offsets set in the acpi_exec and acpi_exec_debug macros, so i added a biosconfig.txt to the source view and used a hex-to-text program to extract the bios configuration as a byte array. this config is in a fairly easy-to-parse format, and can be edited directly using an hex editor, like most bioses have been for years. you can find out more about the parameters for the amibioss from: installing the module for this bios was easy enough using the provided install image, but i didn't get very far testing the module on the actual bios. that is, when i installed the module, it never asked for a password, which would have been the reset all to defaults case, so i wasn't able to move on. i was also unable to change the menus. i probably would have gotten further if i hadn't run into this problem, but i've been on the road for a while, so i'm going to go back to work on this when i get home, and see if i can find a solution. first off, apologies to the individual who replied to this. it turns out the thread isn't active anymore. it looks like it has been 14 months since this was first posted, but that hasn't stopped the newsgroup from being active. i tried to email the original poster last year, but didn't get any response.

AMIBCP V4.53 93

i think you can to wait few days more, coz thats for release of new ami, so again check version you post you can pick proper update if you have fresh bios you get limited period is released to for access, again its not like flash firmware itself will change bios.. but we can use the update to control the options. get everything done at same time, first actually flash firmware, then transfer the.pex to microsoft for post. then switch to those options, work properly or not if you cant wait. not easy to change bios in amibcp, so again keep trying. couldn't understand at all. got confused to a bit, he he from that point, it is relatively easy to change the bios settings, as you can see by the available options on the left side. from there you can adjust speed, such as the 5/4/3/2 and so on, along with timings. the timings matter most in the bios. i usually change it to the biggest one that works. and you can adjust clock cycles to allow the system to reach the specified clock rate. you can also adjust all sorts of features. for example, you can change the otp setting. otp protects the bios from being stolen or unsoldered, but disable the feature completely and it is just as if the password wasn't set, leaving you vulnerable to people hacking through the bios. all you need to do is turn on the feature, and set the password. and you can also turn on temperature monitoring, and adjust fan control by turning them on and adjusting the settings to your liking. if you use the flash tool, it is much harder than just using amibcp. for example, if you flash the driver, you will receive "blobware" as a filename in the flash tool. i think that is why people didn't realize they could use amibcp, if they just used the flash tool. 5ec8ef588b
