In addition to those functions, such devices can also perform other functions such as global positioning system (GPS) functions, for example. As electronic devices have become smaller, consumers have become demanding in their expectations of performance and price. One area of electronics that has undergone a particularly large increase in performance and decrease in size is the digital camera. With the introduction of digital photography, this type of camera has gone from being extremely expensive, almost prohibitively expensive for the average consumer to being relatively inexpensive, and even becoming a commodity.
