Field of the Invention The invention relates to a catheter apparatus for the endoscopic treatment of body parts. 2. Description of Related Art Endoscopic surgery procedures are currently used in medical practice for a wide range of applications. They have in common that the access opening is in the skin and that a wound is created for the introduction of the endoscope. The endoscope is a flexible tube which can be positioned inside the body and can be steered through the body with the aid of a handle. The endoscope contains a camera and a light system which makes it possible to monitor the interior of the body. Depending on the application, the endoscope can be positioned in such a way that the image of the interior of the body can be displayed on a monitor connected to the endoscope. Many types of endoscopes are known. Some are capable of taking biopsy samples, others have a measuring device and a viewing device in one tube. Depending on the application, the endoscope may have several channels for the introduction of instruments to be used in the treatment. The simplest endoscopes, which are used for visual diagnosis, have a channel for water to be introduced into the body and a channel for an operating instrument. More sophisticated endoscopes have a channel for a first instrument, a channel for a second instrument and also a channel for suction, all of which are connected to a channel in the form of a sleeve which extends from the instrument to the endoscope. The endoscope may also have a channel which forms a channel for a spray or jet to be introduced into the body. The endoscope is connected to the patient by a long tube which is positioned in the body in such a way that a distal end of the tube is located close to the skin. For introduction of the endoscope into the body, the opening which

Starting with 1950, I'm counting down until the year 1,000. The current count stands at 538. That's the year 1005. So in the next 20 years, I'd say that my friends and I will have been able to make a dozen or so new friends who all have a few interesting things in common: we all grew up in the first half of the century, we all are living in a different era, we're all born in the same year, and we're all born on January 1st. Oops, wait a minute, that's actually two of us in the same year. 1,750 ish. I was thinking about what I'd call my new friends and

stumbled across an interesting quirk of fate. My best friend from elementary school (married his high school girlfriend for about a decade before their relationship broke up, then they married each other. He recently retired from the U.S. Army after 23 years of service, the last 11 of them in the U.S. Army Reserves, and then went to college at the University of the Pacific), my former high school best friend who I haven't spoken to in over 20 years, and a friend of our high school mutual friend's who I haven't spoken to in 25 years are all the same birth date, except for my high school best friend. The same year. Not so strange in a way, but when I think back to what kind of people I was in high school, these three guys were the three most outgoing, interesting, and fun people in high school. That's going to be the case for the rest of my new friends as well 2edc1e01e8
