The optimal investigation for visual field loss after traumatic optic neuropathy. To determine the best investigation for detecting visual field loss after traumatic optic neuropathy. The records of all patients who had sustained a traumatic optic neuropathy at our institution between 1987 and 2002 were reviewed. In all, 40 patients (21 male, 19 female; mean age 28 years; standard deviation [SD] 6) had a standard automated perimetry (SAP) visual field examination (VFE) and an in-house 30-2 threshold VFE. The sensitivity (Sn) and specificity (Sp) of each test, and the area under the receiver-operating characteristic (ROC) curve, were calculated. Sn and Sp for the SAP VFE were 0.98 and 0.85, respectively, and for the in-house VFE were 0.96 and 0.93. The ROC curve showed that SAP VFE is the best test for detecting visual field loss after traumatic optic neuropathy.
