You can search with any combination of filters, grouped by AND, OR and NOT operations. You can place queries under queries in the navigation tree. When a sub-query is run, it takes issues that satisfy its parent query and filters them further. With few clicks, you can have a set of issues break down by status, by priority or by any other "option-list" attribute. You can see the number of issues that satisfy each query in the navigation tree. This gives you a perspective on the project state. You can see a table-like breakdown of issues with any two "option-list" attributes chosen as axes. This works like a two-dimensional distribution. You can inspect several issue tables, organized in tabs. Each tab keeps its own issue selection, which allows you to "iterate" through different query results at the same time. When table auto-refresh mode is turned on, issue table gets updated immediately with any changes, which makes it an effective monitor of a given query. When this mode is turned off, changes won't be applied until you press Refresh button, which makes it convenient to step through the table without interruptions. When you double-click on a time spent in the search box or in any issue fields, JIRA Client will add a time tracker widget into the existing page. It will increase its size if the issue count is large. The tool does not have any advertising banners. It keeps running smoothly even on slower computers.
